1. Executive Summary

Nivesh is an AI-copilot wealth platform for Indian retail investors and the advisors who serve them. It answers a question most investors cannot answer today: **is my portfolio actually healthy, and if not, what should I do about it?**

Indian households hold a growing share of their savings in mutual funds and direct equity, but the tools available to them stop at reporting. They show **what** a portfolio contains; they rarely explain **whether that is wise**. Nivesh closes that gap. It imports a portfolio in seconds, scores its health across twenty diagnostic checks, explains every finding in plain language, and recommends specific, ranked actions — naming the exact stock or fund to buy, trim, switch, or hold.

The product has two faces built on one engine. The **client experience** is a chat-first copilot: the conversation is home, insight cards surface in the thread, and six analytical dashboards sit one tap away. The **advisor experience** is the same intelligence inverted into a book view — every client triaged by who needs attention, a per-client 360, and an operational SIP board.

The single sentence

Nivesh tells an investor — in plain words — exactly how healthy their portfolio is, and what to do next; and gives their advisor the same truth, scaled across an entire book.

1.1 What this document covers

This PRD specifies the complete Nivesh product as designed: the vision and goals, the two primary personas, the twenty-insight diagnostic framework, the six analytical dashboards and their action matrices, the portfolio builder, the cross-cutting Plan Board, the advisor tools, onboarding, the three shared engines that guarantee consistency, the design system, and a phased build plan.

It is accompanied by **nivesh_app.html**, a clickable twelve-screen prototype. Every screen described in this document exists in that prototype as a working, navigable mockup. Section 12 maps each PRD section to its prototype screen so the two can be reviewed side by side.

2. Vision & Goals

2.1 Problem statement

A typical Indian retail investor accumulates holdings over years — a fund recommended by a friend, a stock bought on a tip, an SIP started and forgotten. The result is rarely a portfolio in any deliberate sense. It is a collection. The investor cannot easily tell whether it is over-concentrated, whether it carries more risk than they intended, whether two of their funds hold the same stocks, or whether they are on track for the goals the money was meant to serve.

Existing apps report holdings and returns. They do not diagnose. The investor is left to interpret raw data they were never equipped to interpret, or to pay for advice they cannot easily verify. Advisors face the mirror problem: managing dozens of clients with no systematic way to know which portfolios have quietly drifted into trouble.

2.2 Product vision

Vision

Make portfolio health as understandable as a credit score, and make acting on it as simple as accepting a recommendation — for every Indian investor, and for every advisor who guides them.

2.3 Goals

Product goals

- **Diagnose.** Convert any imported portfolio into one health score and twenty specific, grounded findings.
- **Explain.** State every finding in plain language a non-expert understands, with the actual number that triggered it.
- **Prescribe.** For each finding, offer ranked actions naming the exact instrument and the trade-off involved.
- **Construct.** Let a client build a new goal-aligned portfolio from their risk profile, income, and horizon.
- **Scale to advisors.** Give advisors the same intelligence as a triaged book, a per-client 360, and an operations board.

Design principles

- **Grounded, never invented.** Every figure traces to the client's own data. The product never fabricates a number.
- **Honest over flattering.** Nivesh shows red when the math is red. A tool that always reassures is worthless.
- **Propose, never execute silently.** The system recommends; the human decides and acts. This keeps the SEBI line clean.
- **One truth, two audiences.** The health score a client sees is the identical number their advisor sees.

2.4 Non-goals (v1)

- Nivesh does not execute trades or place orders. It is a diagnostic and advisory layer, not a broker.
- Nivesh does not hold custody of assets or money.
- Nivesh does not auto-rebalance. Every change is a human-accepted action.

3. Target Users & Personas

Nivesh serves two primary personas. Both bind to the same underlying engine; the product surface differs because their jobs differ.

3.1 Persona A — The retail investor

Attribute	Detail
Who	Indian retail investor, 28–50, salaried or self-employed. Holds mutual funds and often direct stocks.
Context	Has invested for years across multiple apps and AMCs. Holdings accumulated, not designed.
Frustration	Cannot tell if the portfolio is healthy, too risky, or on track. Reporting tools do not diagnose.
Goal	A clear verdict on portfolio health and a short list of concrete things to do about it.
Success	Opens Nivesh, understands their score in 30 seconds, accepts one or two actions with confidence.

3.2 Persona B — The advisor / Relationship Manager

Attribute	Detail
Who	SEBI-registered advisor or RM managing a book of 20–200 client portfolios.
Context	Responsible for portfolio health and the client relationship. Reviews are periodic; problems are not.
Frustration	No systematic way to know which clients have drifted into trouble between scheduled reviews.
Goal	Walk in each day to a triaged list — who needs attention, who is healthy, what is time-bound.
Success	Spends time on the clients who need it, never blindsided by a problem they could have caught.

3.3 How the two relate

The advisor product is the client product **inverted**. The client sees one portfolio in depth; the advisor sees many portfolios at a glance and drills into one. Crucially, the advisor never edits a client's plan silently — advisor-side actions read **Discuss**, not **Accept**. The advisor proposes; the client decides. This preserves the regulatory boundary and the client's ownership of their own money.

4. Product Architecture

4.1 The chat-first model

Nivesh's client experience is organised in three layers, not as a traditional screen hierarchy:

1. **The conversation is home.** There is no dashboard landing page. The client lands in a chat thread that has already analysed their portfolio and surfaced a health score.
2. **Insight cards are rich messages.** Each diagnostic finding appears as a structured card inside the thread — severity badge, headline finding with the real number, two stat tiles, a mini-visual, and two chips.
3. **Dashboards are the detail layer.** The six analytical dashboards are not top-level destinations; they open from an insight card when the client wants depth.

4.2 The diagnose → prescribe → track loop

The product is a closed loop. Every screen plays one role in it:

Stage	Screens	What happens
Import	Onboarding, Review holdings	The portfolio enters the system and is confirmed.
Diagnose	Chat landing, six dashboards	The portfolio is scored; findings are explained.
Prescribe	Recommendation matrices	Ranked actions are offered, each naming an instrument.
Track	Plan Board	Accepted actions are collected and worked to done.
Construct	Portfolio builder	A new goal-aligned portfolio is built from a profile.

4.3 The three shared engines

Beneath every screen sit three engines. They are the reason roughly twenty screens feel like one coherent product rather than a suite of disconnected tools.

Health-score engine

Produces one number, 0–100, with a letter grade. The score a client sees in their chat is the identical score the advisor sees on their book. If these ever diverged, trust would break.

Rule engine

Evaluates the twenty diagnostic signals against the portfolio, each as a deterministic rule, and ranks the resulting findings by severity. This engine drives the insight cards and the dashboards.

Screening engine

Scores every stock and fund in the investable universe on fundamentals and technicals. It is the single source for instrument recommendations — the same engine powers a dashboard switch suggestion, a builder recommendation, and an advisor's proposal.

All three engines operate on **NIDP** — the Nivesh holdings data layer. The grounding discipline is absolute: every figure shown to a user traces to NIDP data, and none is invented.

5. Onboarding & Portfolio Import

Import is the front door and the single highest-anxiety moment in the product. Everything downstream depends on getting the client's holdings in. Nivesh offers three import paths, deliberately ranked by friction.

Path	How it works	Friction & trust note
Gmail CAS import	Nivesh locates the Consolidated Account Statement email sent monthly by CAMS/KFintech and reads it automatically.	Lowest friction — no file, no password. Read-only OAuth scope limited to CAS emails; revocable anytime.
CAS file upload	The client uploads the CAS PDF they already received from CAMS or KFintech.	Medium friction — the client must supply the PDF password. Processed securely, not stored.
Broker connect	The client links their demat account for live direct-stock holdings.	Structurally necessary for stocks — CAS covers funds only. Read-only OAuth; cannot place trades.

5.1 Key requirements

- **Authentication is token-based.** Both Gmail and broker connections use OAuth. Nivesh never receives, handles, or stores an email or broker password.
- **Coverage is explicit.** CAS covers mutual funds across all AMCs but not direct equity. A client with both must use a CAS path and broker connect; the screen states this.
- **There is always an escape hatch.** A client unwilling to connect anything can add holdings manually and import properly later. Onboarding never dead-ends.
- **A review step precedes analysis.** After import, the client confirms the parsed holdings before the first health score is computed. A wrong score must never be a client's first impression.

6. The Insight Framework

Diagnosis rests on a library of **twenty portfolio insights**. Each is a deterministic check: a defined set of input signals, a rule that evaluates them, and a plain-language conclusion. The rule engine runs all twenty and ranks the findings by severity.

6.1 The twenty insights

#	Insight	What it detects
1	Concentration	Too much of the portfolio in one stock, sector, or group.
2	Too many funds	Fund sprawl that adds overlap, not diversification.
3	Smallcap exposure	Smallcap weight beyond what the risk profile supports.
4	Weak diversification	Holdings that move together; little genuine spread.
5	Volatility	Portfolio swings wider than the client's tolerance.
6	Downside protection	Thin buffer against a market fall.
7	Retirement gap	Retirement corpus projected to fall short.
8	Inflation risk	Real returns too low to outpace inflation.
9	Excess cash	Idle cash dragging long-term returns.
10	No emergency fund	No liquid reserve for shocks.
11	Expense ratios	Funds costing more than category peers.
12	Tax inefficiency	Missed harvesting or poor tax structuring.
13	Weak international	Little or no global diversification.
14	Thematic overexposure	Over-reliance on a narrow theme or sector fund.
15	Weak quality	Holdings with poor fundamental quality.
16	Governance risk	Exposure to weak-governance names.
17	Portfolio drift	Allocation has wandered from its target.
18	Emotional risk mismatch	Real risk taken differs from stated comfort.
19	Low return efficiency	Returns weak for the risk being carried.
20	Recession vulnerability	Fragility to a broad downturn.

6.2 The insight card

Every insight surfaces through one reusable card component, so the client learns the pattern once and reads all twenty fluently. Each card carries:

- **A severity badge** — HIGH, MEDIUM, or LOW.
- **A headline finding** — the conclusion with the actual triggering number baked in.
- **Two stat tiles** — the supporting figures.
- **A mini-visual** — a compact chart of the finding.
- **Two chips** — left drills into the relevant dashboard; right asks a follow-up question.

Insights that lack the data to be computed do not disappear — they render as a **Needs-info** variant that tells the client exactly what to provide to unlock the check.

6.3 Build waves by data dependency

The twenty insights are sequenced into three waves by what data each requires:

Wave	Requires	Insights
Wave 1	Holdings math only	Concentration, too many funds, weak diversification, excess cash, drift.
Wave 2	Holdings + market data	Smallcap, volatility, downside, expense ratios, international, thematic, return efficiency.
Wave 3	Holdings + user input	Retirement, inflation, emergency fund, tax, quality, governance, emotional mismatch, recession.

7. The Six Analytical Dashboards

When a client wants depth on a finding, they open a dashboard. There are six. Every one follows an identical three-section template, so the product is learned once and applied everywhere.

7.1 The shared three-section template

Section	Purpose	Contents
① Insight	Diagnose	The headline finding, a hero metric, supporting stat tiles, and a chart.
② Recommendations	Prescribe	A ranked action matrix — each row a priority-badged recommendation.
③ Apply	Commit	A projected-metric footer and a Send-to-Plan-board control.

7.2 The six dashboards

Dashboard	Diagnoses	Matrix impact metric
Concentration	Over-exposure by stock, sector, AMC, company, group	Health points
Diversification	Fund overlap, repeated stocks, category & asset mix	Funds removed / health points
Risk	Beta, volatility, drawdown vs the client's tolerance	Beta reduction
Tax	Harvesting opportunities and tax structuring	Rupees saved
Performance	XIRR vs benchmark; which funds drag returns	XIRR lift
Goals	Funding gaps against each defined goal	Funding percentage

7.3 The multi-lens switcher

Two dashboards — Concentration and Diversification — carry a **lens switcher**. Concentration can be viewed by stock, sector, AMC, company, or promoter group; Diversification by fund overlap, repeated stocks, category, or asset mix. Each lens reads off one shared look-through computation and carries its own caution line, so the same underlying data answers several different questions.

7.4 The action matrix

The recommendation matrix is the heart of every dashboard. Each row is one ranked action:

- **A priority badge** — the rank and a domain-honest label (Critical / Optimise / Enhance for most dashboards; Closes-the-gap / Closes-most / Partial for Goals).
- **An impact / effort / trade-off triplet** — the gain, the work required, and what the client gives up. The trade-off field is mandatory; an honest recommendation states its cost.

- **Accept / Why? / Skip controls** — the client commits, interrogates, or dismisses.

Two-layer instrument moves

Where an action involves a specific instrument, the row expands into a **two-layer** view. Layer one is the category recommendation — for example, “swap a banking fund for a flexi-cap.” Layer two names the exact exit and the exact entry, gives the reasons, and offers two alternatives. Stock verbs are Add / Exit / Trim / Hold; fund verbs are Switch / Exit / Add / Merge / Hold.

Additive vs exclusive actions

In most dashboards, accepted actions are **additive** — accept three concentration trims and all three apply, their impacts summing. The Goals dashboard is the deliberate exception: its actions are **mutually exclusive paths**. Raising the SIP and extending the timeline each independently re-solve the same funding equation, so accepting one clears the others. The matrix component carries an **exclusive** flag per row to encode this.

8. The Plan Board

The Plan Board is the one screen that belongs to no single dashboard. It is the **cross-cutting tracker** where every action accepted across all six dashboards collects, gets worked, and gets marked done. Where dashboards diagnose, the Plan Board is the doing layer.

8.1 Structure

- **Status spine** — actions move through To-do, Done, and Skipped. Done actions show the health they delivered; skipped actions stay struck-through but recoverable, never silently deleted.
- **Two scores** — a current projected health (base plus points already earned) and a target (base plus all accepted actions). The gap between them is the visible motivator.
- **Source memory** — every action remembers its origin dashboard, shown on a coloured rail; a tap returns the client to where the action came from.

8.2 Score reconciliation

Why the numbers reconcile

Each action carries the identical impact value it had in its source dashboard's matrix. When every action is marked done, the Plan Board's projected score equals the sum of every dashboard's projection. The numbers reconcile because there is one health-score engine, called per action — not several independent calculators that would drift apart.

9. The Portfolio Builder

The dashboards diagnose an existing portfolio. The builder is the forward-looking counterpart — it constructs a new, goal-aligned portfolio from a client's profile. It is a flow, not a dashboard.

9.1 The builder flow

Step	Screen	What happens
1	Risk profile	A questionnaire places the client in a risk band.
2	Editable allocation	A suggested equity / debt / gold / cash mix the client can override, with a drift guardrail.
3	Recommendations	Top stocks and funds, scored on fundamentals and technicals.
4	Instrument sizing	The sleeve amount is split into specific per-instrument rupee amounts.
5	SIP planner	The monthly amount is split across goals, with a future-value funding check.
6	Review & register	The full plan is confirmed and the SIPs are registered.

9.2 The editable allocation

The risk band yields a **suggested** mix; the client or advisor may drag it anywhere. A **drift guardrail** computes the deviation from the assessed profile and labels it green, amber, or red. The guardrail never blocks an override — it makes the deviation visible. A builder that forces the preset is paternalistic; one with no guardrail is reckless.

9.3 Instrument-level sizing — the hard part

Turning “60% equity” into specific rupee amounts per instrument is the most difficult problem in the builder. Nivesh solves it in three visible steps:

4. **Score-weight.** The sleeve is split in proportion to each instrument's blended score from the screening engine — a higher-quality instrument earns a larger share.
5. **Apply caps.** Per-instrument caps prevent over-concentration. Single stocks are capped tighter (~10–12%) than funds (~25–35%), because a fund is already internally diversified. Excess above a cap is redistributed.
6. **Snap to clean tickets.** Raw amounts round to ₹500 multiples; the rounding residue is absorbed so the sleeve total is conserved exactly.

The result is a defensible **starting point**, never a lock. The client can override any row; the sleeve total stays conserved, and any cap breach flags visibly. Caps themselves derive from the risk band, so the whole builder is internally consistent.

9.4 The funding check

The SIP planner runs a standard future-value projection for each goal and reports, honestly, whether the plan reaches the target. It will show **red** when the math does not work. A builder that always shows green is useless; the value is the moment it shows red and the client sees the trade-off.

10. The Advisor Experience

The advisor product is the client product inverted — the same engine, re-aggregated for someone managing many portfolios. It has three screens.

10.1 Advisor Book

The book exists to **triage, not browse**. It defaults to a “Needs attention” filter, not “All,” because an advisor wants today's call list, not a directory. Clients are computed into three bands — needs attention, review soon, healthy — and the list carries two columns the client screen never had: **last seen** and a **priority sort** that blends health, time-sensitivity, and contact gap. A healthy portfolio gone 60 days without contact still surfaces, because silence is its own risk.

10.2 Client 360

Opening a client gives the advisor the **same six dashboards the client sees**, as a grid of domain tiles, plus a “What needs you” list that assembles the open, advisor-relevant items into a call agenda. Every action here reads **Discuss**, not Accept — the advisor proposes, the client decides.

10.3 SIP Board

The SIP Board is **operations, not advice**. Where the book asks “whose portfolio needs advice?” the SIP Board asks “whose money did not move this cycle?” It triages every SIP into four queues — Failed, Expiring, Step-up due, Healthy — and the action is queue-specific: a failed debit names its actual reason (insufficient balance, mandate limit, closed account) so the fix is obvious. The Step-up queue is fed by the Goals dashboard: a “raise SIP” recommendation becomes a step-up item here, the one place advice and operations touch.

11. Design System

Nivesh uses a single warm-dark visual system across every screen. Consistency here is what makes twenty screens feel like one product.

11.1 Colour

Role	Token	Use
Background	#0b0a08	The near-black canvas behind every screen.
Surfaces	#161310 – #252119	Cards, tiles, and raised elements.
Saffron accent	#ff9248	The primary brand accent and call-to-action colour.
Moss	#88ab66	Healthy / positive states.
Gold	#d9b64a	Caution / medium-severity states.
Rust	#df5d5d	High-severity / at-risk states.
Indigo	#7d7eff	Informational and neutral highlights.

11.2 Typography

- **Fraunces** — a serif display face for headline moments and the health score.
- **Inter Tight** — the body and interface typeface.
- **IBM Plex Mono** — meta labels, badges, and figures.

11.3 Brand mark

The Nivesh mark is a saffron rounded square carrying the Devanagari letter “न” — the first letter of Nivesh, the Hindi word for investment.

11.4 Grounding discipline

A design rule with product weight: every figure on every screen traces to NIDP data, and none is invented. Where a number cannot be computed, the screen says so plainly. The product's credibility rests on this discipline.

12. Mockup Walkthrough — Prototype Map

This PRD ships with **nivesh_app.html**, a self-contained, clickable prototype of twelve screens in the warm-dark design system. It is the walkthrough companion to this document: every screen specified above exists there as a working, navigable mockup with real interactivity — lens switchers, accept flows, sliders, and filters.

12.1 Screen-to-section map

Prototype screen	Specified in	Interactive in the mockup
Homepage	§ 2	Marketing hero; routes into the product.
Login	§ 5	Client and advisor sign-in paths.
Onboarding	§ 5	The three import paths as a ranked choice.
Chat insight landing	§ 4, 6	Health score, top insight cards, top recommendation.
Concentration dashboard	§ 7	Five-lens switcher; live action matrix with Accept.
Risk dashboard	§ 7	Risk drivers; matrix with projected-beta footer.
Plan Board	§ 8	Mark-done / skip; live projected-health ring.
Portfolio builder	§ 9	Live risk / surplus / horizon sliders; funding check.
Instrument allocation	§ 9	Per-instrument sliders; caps and balance guardrail.
Advisor book	§ 10	Band filters and priority sort over a client list.
Client 360	§ 10	Six domain tiles; the “What needs you” agenda.
SIP Board	§ 10	Four operational queues with queue-specific actions.

12.2 Suggested walkthrough path

To demonstrate the full product to a stakeholder, follow the client loop then the advisor loop:

1. Homepage → Login → Onboarding — show the three import paths and pick one.
2. Chat landing — point out the health score and the ranked insight cards.
3. Open the Concentration dashboard — switch lenses, accept a matrix row, watch projected health rise.
4. Plan Board — mark an action done; the projected-health ring climbs toward the target.
5. Portfolio builder → Instrument allocation — drag the sliders; show the funding check and the caps guardrail.
6. Advisor book → Client 360 → SIP Board — show the same intelligence scaled to a book.

Note on the prototype. nivesh_app.html is a faithful, interactive prototype on representative data. It is not the production application: it does not perform real CAS parsing or broker authentication and is not yet wired to live NIDP data. It is the right artifact for communicating the product vision and letting a stakeholder feel the flow.

13. Build Phasing & Open Questions

13.1 Phased delivery

Phase	Scope	Depends on
Phase 1	Onboarding, CAS import, Wave 1 insights, health score, chat landing.	NIDP holdings layer; CAS parsing.
Phase 2	Wave 2 insights, all six dashboards, action matrices, Plan Board.	Market-data feed; screening engine.
Phase 3	Wave 3 insights, portfolio builder, instrument sizing, SIP planner.	Risk-profile questionnaire; user-input capture.
Phase 4	Advisor book, Client 360, SIP Board.	Advisor data model; SIP operations feed.

13.2 Open questions

Four questions surfaced during design remain for product, compliance, and engineering to resolve:

- **Research Analyst registration.** Stock-level recommendations may require SEBI RA registration, a higher bar than RIA. Compliance review needed before stock recommendations ship.
- **Advisor tier structure.** Whether a senior/branch roll-up is in scope. This changes the data model to client → RM → branch.
- **SIP retry mechanics.** Whether a failed SIP is advisor-retriggerable or notify-only depends on the BSE Star / MFU integration capability.
- **Return assumptions.** Expected-return figures per risk band should be advisor- and compliance-configurable, not hardcoded constants.

13.3 Success metrics

Metric	Definition	Target
Time to first score	Onboarding start to health score shown	Under 60 seconds
Insight comprehension	Users who say the score was clear	Over 85%
Action acceptance	Users accepting ≥ 1 recommendation	Over 40%
Advisor coverage	At-risk clients reviewed within SLA	Over 90%
